**Re: Texas Custodial Trust
Former ASARCO Smelter Site, El Paso, Texas**

**Subject: Transmittal of 2012 Groundwater and Surface Water Sampling Results
Summary**

Dear Mr. Settemeyer:

This letter transmits and summarizes the analytical results associated with semiannual groundwater and surface water sampling activities performed by Malcolm Pirnie at the Former ASARCO LLC (ASARCO) El Paso smelter site (Site) in El Paso, Texas during 2012.

Remedial actions and monitoring at the Former ASARCO site are being conducted by the Texas Custodial Trust (Trust), the property Trustee, on behalf of the Trust's beneficiaries, the State of Texas, represented by the Texas Commission on Environmental Quality (TCEQ), and the United States of America, represented by the United States Environmental Protection Agency (USEPA). Environmental impacts from historical smelting operations are present within the plant site, the adjacent arroyos, the floodplain of the Rio Grande west of the plant site, and the East Property located east of Interstate 10 (I-10) (see Figure 1).

Regular groundwater and surface water monitoring activities at the Site began in 1997. Until 2003, the monitoring activities were performed on a quarterly basis. Starting in 2004, the monitoring activities were reduced to two sampling events per year. The 2012 groundwater and surface water sampling collection and analytical activities were performed in accordance with the Remedial Action Work Plan (RAWP). As described in the RAWP, continued monitoring of groundwater is warranted to evaluate Site conditions and support the design of final groundwater remedies. The Interim Site monitoring program for 2012 consists of semiannual sampling of groundwater monitoring wells (43 monitoring wells during the first sampling event and 42 monitoring wells during the second sampling event) and 11 surface water locations from the surrounding water bodies near the Site, the American Canal and the Rio Grande (see Figure 1).

Groundwater Sampling

The two semiannual Interim Site monitoring events for 2012 were performed during February/March (spring) and August/September (fall) timeframes. Locations of monitoring wells included in the Interim Site monitoring for the spring and fall sampling events are shown in

Figure 1. Well EP-85 was part of the monitoring wells sampled during the spring sampling event, but was not included during the fall sampling event since the well was plugged and abandoned in between the two events. Monitoring wells MW-9D, MW-9S, MW-10D, MW-10S, MW-11D, and MW-11S were installed on March 19 through March 21, 2012 and sampled on March 27, 2012. These wells were included in both, spring and fall monitoring sampling events. Samples collected during the 2012 monitoring events were analyzed for site constituents of concerns (COCs), analytes of interest (AOIs), and water quality parameters to support the conceptual site model (CSM) and the detailed evaluation of final groundwater remedies. Table 1 summarizes the results of the wells sampled for both sampling events. The laboratory analytical reports are included in Attachment A.

Groundwater Results Summary

The COCs detected at concentrations above TCEQ Tier 1 Groundwater Protective Concentration Limits (PCLs) for Commercial/Industrial use are: antimony, arsenic, cadmium, chromium, cobalt, copper, lead, nickel, mercury, molybdenum, selenium, and thallium with the primary COCs being arsenic and selenium. The COCs detected at concentration above the groundwater PCLs for both spring and fall sampling events are bolded and highlighted in Table 1 and are consistent with concentrations previously detected at the site. An expanded analysis of the sampling results will be reported to TCEQ as part of the Supplemental Remedial Investigation Report currently being prepared.

Surface Water Sampling

Surface water monitoring is performed at eleven surface water stations (SEP-1 through SEP-4, SEP-6, SEP-7, and SEP-9 through SEP-13); four on the American Canal and seven on the Rio Grande (see Figure 1). Samples collected during the spring and fall events were analyzed for Site COCs, AOIs and water quality parameters. The analytical results from the surface water monitoring events are presented in Table 2 and the laboratory analytical reports are included in Attachment A.

Surface Water Results Summary

Surface water level fluctuates seasonally throughout the year. The low flow period time takes place during the spring sampling event while the surface water levels are higher during the fall sampling event. The surface water analytical results collected from the American Canal and the Rio Grande during the spring monitoring event had concentrations above drinking water standards for arsenic of 0.01 mg/L on all the sampled locations with the exception of SEP-1 and SEP-9. The maximum arsenic concentration detected was at sample location SEP-10 (0.239 mg/L) for the spring event. The rest of the COCs from the surface water sample locations were either not detected or detected below the drinking water standards during both spring and fall monitoring events.

Conclusions and Observations

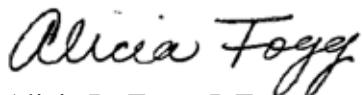

Groundwater at the Site is impacted by historical smelter operations. The primary groundwater and surface water COC at the Site is arsenic due to its elevated concentrations, areal extent and impacts to surface water, and thus will drive remediation efforts at the Site. Elevated concentrations of Site COCs are observed across the Site and distribution is driven by the former arroyo and Floodplain hydrogeology, location of source areas, and to a lesser extent, the groundwater geochemistry.

Interim Site monitoring of groundwater and surface water will continue on a semiannual basis until the final groundwater remedy is implemented at which point the groundwater monitoring program will be transitioned to a performance monitoring program. Additional modifications to the Interim Site monitoring program, increased or decreasing the number of sampling points may be necessary to accommodate remedy implementation activities.

If you have any questions regarding this submittal, please call me at (512) 527-6101.

Very truly yours,

MALCOLM PIRNIE, INC.

Notes:

Bolded value = Result exceeded TRRP Protective Concentration Limit

TRRP Protective Concentration Limit = ^{GW}GW_{ing} based on TRRP Table 3 for commercial/industrial sources, Class 1 groundwater source
mg/L = milligrams per liter

-- = Not applicable

< = Analyte not detected above listed sample detection limit

J = Estimated value

UJ = Estimated reporting limit
